

HU3910  
Serial Number Database  
D22 Group  
4/26/2022

### Summary of the previous version

The project aims to create a platform for musicians to register and track their instruments. It allows users to create an account with an email address. The main functions of this platform include “Adding” instruments with specific descriptions and tags to the account, claiming the status of instruments (stolen or in possession), “checking” instruments with serial numbers and contacting other users.

E21 group tried to create an image uploading system and you can see an image upload button in “Add”, but it’s not functioning so far.

## Add Instrument

The screenshot shows a form titled "Add Instrument" with the following fields and values:

- Instrument Nickname:** My Guitar
- Serial #:** GX-123456
- Description:** Scratch on the outer edge of the guitar, initials on back of body.
- Make:** Gibson
- Model:** ES-175
- Year:** 1994
- Status:** In My Possession
- Images:** Upload files

A blue "Add Instrument" button is located at the bottom of the form.

fig.1 Previous “Add”

The screenshot shows the updated "Add Instrument" form within a web browser interface. The browser's address bar shows "SerialNumberDB" and the navigation menu includes "Dashboard", "Check", and "Add". The form fields are:

- Instrument Nickname:** My Guitar
- Serial #:** GX-123456
- Description:** Scratch on the outer edge of the guitar, initials on back of body.
- Category:** Guitar
- Make:** Gibson
- Model:** ES-175
- Color:** Blue
- Year:** 1994
- Status:** In My Possession
- Images:** Upload files

A blue "Add Instrument" button is located at the bottom of the form.

fig.3 Previous “Check”

**Quick Check**

Enter Instrument Specifications to Search By

Serial Number

GX-45628957289

Make

Gibson

Model

ES-175

Year

1994

Color

Blue

Category

Guitar ▾

[Check](#)

fig.4 Updated “Check”

### Updates of the current version

Being able to search not just by serial number but also by categories

Different instruments can have the same serial number - could be dual primary key

Handling duplicate serial numbers.

Added “category” and “color” tags in “Add”.

Added the ability to check by any of the fields that we add to an instrument.

### Issues

We decided to focus on front-end developments during this project. Because of this, we have the website looking good for the ADD and CHECK pages, but the info does not pass into the database correctly yet.

### Future developments

Utilize Ebay, reverb, craigslist crawlers to get notified when any an instrument with matching criteria gets posted

- Ideally, we can specify the matches that we want to be notified for. Ex: any bass, or just a fender bass

Upload images through cloudinary

Deploy entire database to digital ocean, so it isn't just on a wpi system

## To take over...

1. If <https://serialnumberdatabase.wpi.edu/> is not up and running, contact Emerald Toto from IT to start the Docker image that runs the website.

2. Clone the git repository (you will need some proficiency with git)

3. Set up the development environment

It was a bit confusing when our group tried getting started, so here are some tips.

To get started, go to the Git Repository and read through the readme file.

You will need to **install Docker and VScode**.

The latest code is under the **master** branch.

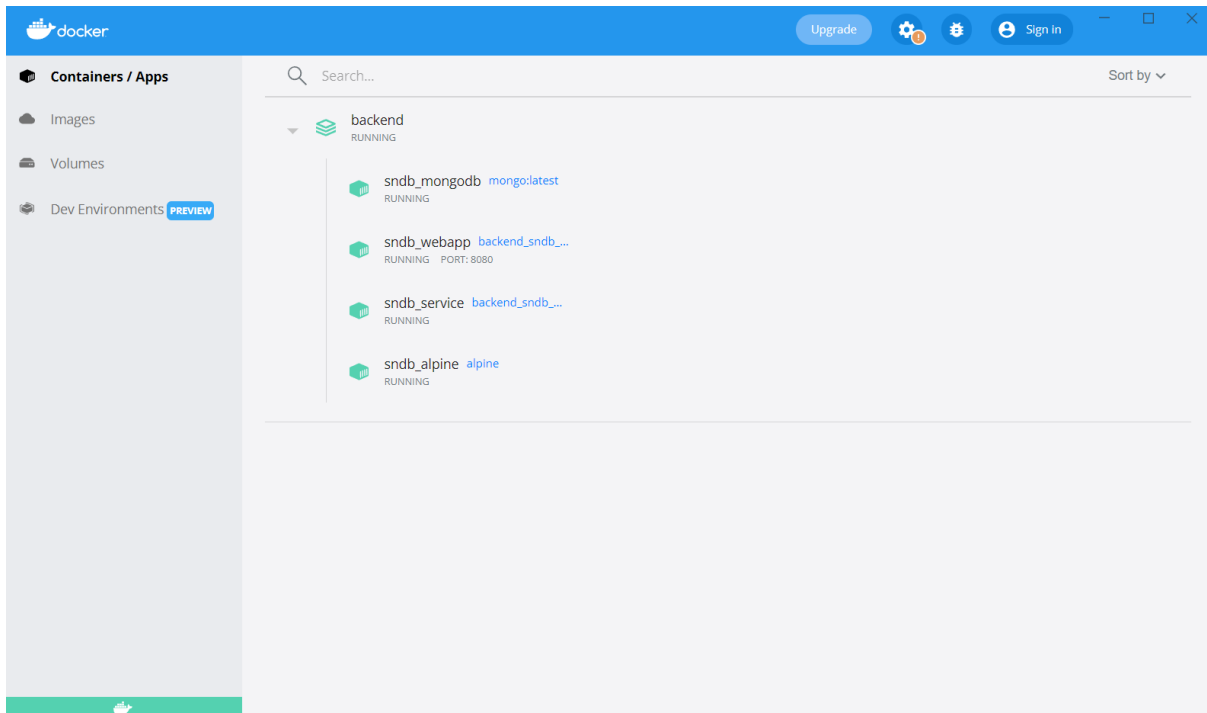

The project keeps being passed from group to group, so some comments might not be specific enough. Check out the Section 0 file structure to get started.

    //if you have the docker plugin
```

fig.5 Section 0: File Structure

Use the commands in the ReadMe to:

- Build a Docker Image
- Create the Bridge Network
- Create a new MongoDB container
- Run the `sndb\_service:1.0` Docker image in a new container
- Run the web\_app either containerized or non containerized

#### 4. Testing

Test changes by right clicking on the docker-compose.yml file on the left side bar in vs code and click “Compose Up” to run either the containerized or non-containerized docker image depending on how you set up your environment (we used the containerized setup) Then open Docker and you should see the database build.

- Once you have the docker container running, you can run the launch.json file in vs code. This will run the website on your local host.
  - Be sure to have either line 5 or 6 in the `.env` file uncommented depending on if you are running it containerized or non containerized
- When you are happy with your changes, push them to the remote origin master branch in git.
- Once the master branch has your changes, <https://serialnumberdatabase.wpi.edu/> should reflect them as well.
